

New earthworm records from Bulgaria (Oligochaeta, Lumbricidae)

T. SZEDERJESI

Tímea Szederjesi, Department of Systematic Zoology and Ecology, Eötvös Loránd University, H-1117 Budapest, Pázmány P. sétány 1/C. E-mail: t.szederjesi@gmail.com

Abstract. Elaboration of a small earthworm material collected in different parts of Bulgaria resulted in recording altogether 15 species. Surprisingly, the peregrine *Dendrobaena veneta veneta* proved to be new to the fauna of Bulgaria and with this, the present list of Bulgarian earthworms consists of 42 confirmed species and subspecies.

Keywords. Earthworms, faunistics, new records, Bulgaria.

INTRODUCTION

The earthworm fauna of Bulgaria is far from well known, although the beginning of the researches goes back to the end of the 19th century. Rosa (1897) was the first who published data on the Bulgarian earthworms. His work was followed by Černosvitov (1934, 1937), Plisko (1963) Mihailova (1964, 1965, 1966) and Zicsi & Csuzdi (1986). Recently, Valchovski (2012) summarized the knowledge about the Bulgarian earthworm fauna and reported the presence of 50 species and subspecies including several unconfirmed records as well.

In the last decade, researchers of the Hungarian Natural History Museum organized several collecting trips to the Balkan Peninsula. The earthworm material collected from Bulgaria has been elaborated and the results are hereby presented.

MATERIAL AND METHODS

Earthworms were collected by the diluted formaldehyde method (Raw 1959), complemented with digging and searching under stones and the bark of fallen logs. The specimens were killed and fixed in 96% ethanol, then transferred into 75% ethanol and deposited in the earthworm collection

of the Hungarian Natural History Museum (HNHM). For later molecular studies, tail parts of specimens of taxonomic importance were placed into 96% ethanol.

The sampling localities in Bulgaria are shown in Figure 1 and in the text the site numbers are indicated in brackets.

RESULTS

Aporrectodea jassyensis (Michaelsen, 1891)

Allolobophora jassyensis Michaelsen, 1891: 15., Plisko 1963: 430., Mihailova 1966: 188.
Aporrectodea (*Aporrectodea*) *jassyensis*: Mršić 1991: 316.
Aporrectodea jassyensis *jassyensis*: Valchovski 2012: 89.

Material examined. HNHM/16074 1 ex., (No. 16) Haskovo province, Gorata Mts., Borislavci, brook in a beech forest W of the village, 225m, N41°39.542' E25°53.406', 29.05.2012., leg. J. Kontschán, D. Murányi, T. Szederjesi; HNHM/16085 1 ex., (No. 16) Haskovo province, Gorata Mts., Borislavci, brook in a beech forest W of the village, 225m, N41°39.542' E25°53.406', 29.05.2012., leg. J. Kontschán, D. Murányi, T. Szederjesi; HNHM/16088 3 ex., (No. 15) Kărdžali province, Šarta Mts., Pelin, mixed pine forest NE of the village, 645m, N41°31.070' E25°47.010', 29.05.2012., leg. J. Kontschán, D. Murányi, T. Szederjesi.

***Eisenia storkani* (Černosvitov, 1934) stat. nov.**

Eisenia rosea var. *storkani* Černosvitov 1934: 74., 1937: 80.
Eisenia (Dendrobaena) grandis *storkani*: Zicsi & Csuzdi 1986: 119.

Eisenia grandis *storkani*: Mršić 1991: 510., Valchovski 2012: 94.

Material examined. HNHM/15334 1 ex., (No. 4) Sliven province, Stara Planina, Slivenska Mts.,

Sinite Kamâni Natural Park, Karandila, karstic spring, 05.09.2005., leg. M. Földvári, J. Kontschán, D. Murányi, T. Szüts; HNHM/15582 1 ex., (No. 8) Sofia province, Rila Mts., Marica basin, Stream Prava Marica at Zavračica mountain hut, 2189m, N42°10.073' E23°38.483', 08.09.2005., leg. M. Földvári, J. Kontschán, D. Murányi, T. Szüts

Remarks. This species was described by Černosvitov (1934) as *Eisenia rosea* var. *storkani* from Belasica Mts., South-Western Bulgaria. Because of its fasciculated longitudinal musculature and the position of its clitellum (26–32) later, Zicsi & Csuzdi (1986) placed it into the *Eisenia grandis* species group, which unites large bodied species that live mainly in the Caucasus region and possess striped pigmentation. Considering the clitellum and musculature, this species may also belong to the *E. grandis* species group, but its small size and the lack of pigmentation shows that *E. storkani* should be regarded as a separate species. Probably *E. storkani* has closer relations with *E. ebneri* (Michaelsen, 1914), *E. kattoulae* Zicsi & Michalis, 1981 and *E. oreophila* Szederjesi & Csuzdi 2012, all from Greece.

DISCUSSION

According to the present and literature data, the number of recorded earthworm species and subspecies known from Bulgaria is 51. This seems to be relatively few, but we have to consider that Bulgaria is an under-researched area and there have been no focused earthworm collections except a few regions.

Besides, there are some uncertainties in the data published. Mihailova (1968) reported the presence of three Dacian endemisms from Bulgaria; *Octodrilus frivaldszkyi* (Örley, 1885), *Oc. exacystis* (Rosa, 1896) and *Oc. gradinescui* (Pop, 1938). However, *Oc. frivaldszkyi* lives solely in the Transylvanian Island Mts. (Apuseni) (Pop *et al.* 2010) so its presence in Bulgaria is inconceivable. *Oc. gradinescui* (Pop, 1938) occurs only inside the Carpathian Basin and doesn't cross the Carpathians (Csuzdi *et al.* 2011). Although *Oc. exacystis* (Rosa, 1896) is present on the outer side of the Carpathians (Pop 1949) as a typical montane species its occurrence in Bulgaria requires further corroboration.

Aporrectodea carpathica (Cognetti, 1927) a Carpathian endemism was also listed by Mihailova (1964) but this species is missing even from the Southern Carpathians (Csuzdi & Pop 2006).

Again Mihailova (1964) indicated the presence of *Perelia phoebea* (Cognetti, 1913) in Bulgaria. This species was described from Rhodos Isl., Greece and its occurrence in Bulgaria is not plausible.

Another uncertain data is *Allolobophora mehadiensis mehadiensis* (Rosa, 1895), which is also of Dacian origin, but it possesses a wider range, so its occurrence in Bulgaria is feasible, but needs confirmation.

The presence of *Bimastos parvus* (Eisen, 1874) a peregrine species of North American origin is also need to be corroborated. The previously published Hungarian and Romanian records all proved to be misidentifications of *Allolobophoridella eiseni* (Levinsen, 1884) (Csuzdi & Zicsi 2003).

The list of Valchovski (2012) contains also some highly disputed subspecies like *Dd. rubidus tenuis* and *Eis. tetraedra pupa* which are commonly regarded only as parthenogenetic forms (Csuzdi & Zicsi 2003). Consequently the present list of Bulgarian earthworms consists of 42 confirmed species and subspecies.
